STA521_Lab03_2024Fall

Justin Kao

2024-09-23

Obtain the data and manipulate it into the appropriate format.

Load Data

```
data("Ozone", package = "mlbench")
```

Data Wrangling

```
names(Ozone) <- c("Month", "Day_of_Month", "Day_of_Week", "Ozone",
                        "Pressure", "Wind", "Humidity", "Temp1", "Temp2",
                        "Inversion_Height", "Pressure_Gradient",
                        "Inversion_Temp", "Visibility")

Ozone <- na.omit(Ozone)

nrow(Ozone)
```

```
## [1] 203
```

```
Ozone$Month <- as.numeric(Ozone$Month)
Ozone <- Ozone[, !(names(Ozone) %in% c("Day_of_Month", "Day_of_Week"))]
str(Ozone)
```

```
## 'data.frame':    203 obs. of  11 variables:
##  $ Month            : num  1 1 1 1 1 1 1 1 1 1 ...
##  $ Ozone            : num  5 6 4 4 6 6 5 4 4 7 ...

Final Model Comparison and Conclusion

1. AIC (Akaike Information Criterion) Comparison

- Lower AIC values indicate a better balance between goodness-of-fit and model complexity.
- The **Reduced LogOzone GLM Gamma** model has the **lowest AIC (206.96)**, making it the best model based on model selection criteria.
- Other models (Full LM, Full GLM Gaussian, Full GLM Gamma) have similar AIC values of around **1186**, which are much higher, indicating worse performance compared to the reduced LogOzone GLM Gamma model.

2. RMSE (Root Mean Squared Error) Comparison

- RMSE measures prediction accuracy, with lower values being better.
- The **Reduced LogOzone GLM Gamma** model has the **lowest RMSE (1.571)**, followed closely by the **Full LogOzone GLM Gamma** with **RMSE = 1.988**.
- The original models (Full LM, Full GLM Gaussian, Full GLM Gamma) have much higher RMSE values of around **4.24**, indicating less accurate predictions compared to the LogOzone models.

3. MAE (Mean Absolute Error) Comparison

- MAE measures the average magnitude of prediction errors, with lower values indicating better performance.
- The **Reduced LogOzone GLM Gamma** model has the **lowest MAE (1.497)**, followed by the **Full LogOzone GLM Gamma** with **MAE = 1.834**.
- The Full LM, Full GLM Gaussian, and Full GLM Gamma models have higher MAE values of **3.416**, and the Reduced GLM Gamma model performs the worst with an MAE of **11.25**.

Conclusion

Based on all three metrics (AIC, RMSE, and MAE): - The **Reduced LogOzone GLM Gamma** model performs the best overall. It has the lowest AIC, RMSE, and MAE, indicating that it balances model complexity, prediction accuracy, and overall fit better than the other models. - The **Full LogOzone GLM Gamma** model also performs well, especially in terms of prediction accuracy, though its AIC is slightly higher compared to the reduced version.

Therefore, the **Reduced LogOzone GLM Gamma** model is the best choice for predicting the daily maximum one-hour average ozone reading in this case.
